

Your site is telling Google not to index it

The homepage is serving this in its <head>:

html

```
<meta name="robots" content="noindex, nofollow">
```

That is an explicit instruction to every search engine: *do not index this page, do not follow its links*. This is almost always a leftover from a staging environment that never got removed at launch.

I verified the effect — I searched your exact domain and got nothing but Alexandre Dumas results. Your company does not appear in search results at all. No amount of SEO work matters until this one line is deleted. Fix this today, then submit the site in Google Search Console.

Fix it

Other technical and SEO issues

Your title tag is an internal project name. The page title is literally "Redesign Trois Mousquetaire Site." That string is what shows in browser tabs, bookmarks, search results, and shared links. It should be something like Trois Mousquetaires — Custom Software Development & IT Services.

Fix it, New Page Title: Reliable IT Solutions for Growing Businesses | Trois Mousquetaires

The brand name is spelled three different ways. Domain says *troismousquetaires* (plural), title says *Mousquetaire* (singular), meta description says *Mousquetaire's*. Pick one spelling and enforce it everywhere.

```
<!-- HTML Meta Tags --> <title> Reliable IT Solutions for Growing Businesses | Trois Mousquetaires </title>
<meta name="description" content="We design, build, and scale enterprise digital solutions. Partner with a
dedicated engineering team specializing in cloud tech, web development, and IT consulting.">
```

The meta description reads like it was auto-generated by a dev tool. It currently describes the *website* — "This web application showcases... offering users a modern interface" — rather than the business. Nobody searching for a development partner care that you have a modern interface. It also contains no service specifics, no differentiator, no location, no reason to click.

Fix the Meta, and Go to Contact Us Page, Replace Email with contact@troismousquetaires.com and Remove Phone and Address from that page

Nothing renders without JavaScript. My fetcher received an empty HTML shell — zero body content, both attempts. Google can execute JS, but it's a delayed second pass with a crawl budget. Bing, LinkedIn's preview bot, WhatsApp, Slack, and most AI crawlers do not run JS at all. If you're on Next.js, switch the marketing pages to static generation or SSR. This is a bigger deal than it sounds in 2026 — a growing share of B2B buyers now finds vendors through AI assistants, and those crawlers see nothing on your site.

Fix it

No Open Graph or Twitter card tags. No og:title, og:description, og:image. When anyone shares your link on LinkedIn — the primary channel for B2B IT services — it renders as a naked URL with no image or text. This is a five-minute fix with outsized impact.

No structured data. No Organization or Service schema. This is how search engines and AI answer engines confirm what your company is, where it's based, and what it does.

Also absent from the head: canonical tag, no visible favicon reference, no lang attribute. The head is unusually bare — only three meta tags total.

Fix it all, I am attaching Favicon please use that
