Hero

Stack Tower

Tap to drop. Land it clean. Climb.

A one-tap arcade stacker where a single mistimed tap costs you the run — wrapped in four modes, a daily challenge, and a progression loop that gives you a reason to come back tomorrow.

Role Design and development · **Platform** Android · **Scope** Game design, UI, visual identity, store assets

Overview

Stack Tower takes the purest possible input — one tap — and asks how much game you can build on top of it. A block slides across the screen; you tap to drop it onto the tower below. Whatever hangs over the edge is sliced away, so every imprecise drop makes the next one harder. The tower narrows until there's nothing left to land on.

That core takes about four seconds to learn. The design work went into everything around it: four modes that ask genuinely different things of the player, a daily challenge that puts everyone on the same seed, and a reward economy that turns a two-minute session into a habit.

How it works

The block travels horizontally at a constant speed and you tap once to place it. Land it flush with the block underneath and you get a **perfect drop** — no width lost, and your combo climbs. Land it off-centre and the overhang is cut away permanently. Miss entirely and the run ends.

Because width is never recovered by ordinary drops, precision compounds. A player who lands three perfects early is playing a fundamentally wider, more forgiving tower than one who didn't — which is what makes the skill ceiling real rather than cosmetic.

Four modes

Classic — Endless. No timer, no restrictions, just how high you can get.

Time Attack — Sixty seconds on the clock, and every perfect drop buys you another second. Precision stops being about width and becomes about survival.

Precision — Perfect drops only. A single imperfect landing ends the run.

Daily Challenge — One seeded puzzle per day, identical for every player, resetting on a visible countdown.

Each mode tracks its own best score, so a player who's stuck in Classic still has somewhere to make progress.

Progression

Runs pay out in coins and XP. Coins come from gameplay, daily rewards on an escalating seven-day streak, and mission completions; XP drives an account level that carries across all four modes. Achievements fire on milestones and pay a coin bonus on top.

Three daily missions rotate — a height target, a cumulative perfect-drop count, and a coin goal — deliberately spanning one run, several runs, and a session, so there's always one that's nearly done.

The game-over screen is where all of this lands at once: score, mode best, combo, coins earned, XP gained with the level bar advancing, and any achievements unlocked. It's the densest screen in the game by design — it's the moment a player decides whether to tap "again."

Visual identity

The wordmark is built on deliberate misregistration — white type sitting over offset colour duplicates in orange-yellow and cyan-purple, like a print run that slipped. It's a direct nod to the mechanic: blocks that don't quite line up. The same palette carries into the UI, with each mode owning an accent colour (cyan, orange, yellow, purple) so mode context is readable at a glance from the card list through to the in-run header pill.

Everything sits on a deep navy that keeps the block colours bright without the interface competing with the play area.
